The North Carolina Violent Death Reporting System (NC-VDRS) is a CDC-funded statewide surveillance system that collects detailed information on deaths that occur in North Carolina resulting from violence: homicide, suicide, unintentional firearm deaths, legal intervention and deaths for which intent could not be determined. NC-VDRS is a multi-source system that gathers information from death certificates, medical examiner reports and law enforcement reports. The goal of this system is to aid researchers, legislators and community interest groups in the development of public health prevention strategies to reduce violent deaths. All deaths reported in this document are based on location of occurrence rather than residence and, instead of a rate, the occurrent ratio is reported. This statistic is derived from the total number of violent deaths resulting from injuries in a specified geographic region divided by the number of residents in this region. This document summarizes all fatal injuries from violence that occurred in Iredell County for the years 2009-2018.

- In Iredell County, the suicide ratio was 3.2 times higher in males than in females, and the homicide ratio was 5.6 times higher in males than in females.

- Patterns of suicide and homicide differed by race. Suicide victims were more likely to be non-Hispanic (NH) white than non-Hispanic Black. NH whites had 20.1 suicides per 100,000 population versus 4.0 suicides per 100,000 population in NH Blacks. All other racial groups combined had eight suicides.

- In contrast, NH Blacks had 9.7 homicides per 100,000 population as opposed to NH whites who had 1.8 homicides per 100,000 population. All other racial groups combined had five homicides.

- For the years 2009-2018, there were 317 violent deaths from injuries sustained in Iredell County. Of these 317 deaths, 316 were N.C. residents (99.7%) and 288 were Iredell County residents (90.9%).

- There were 247 suicides (77.9%), 49 homicides (15.5%), five unintentional firearm deaths (1.6%), five deaths from legal intervention (1.6%), and 11 deaths of undetermined intent (3.5%).
• Suicides and homicides displayed dissimilar age patterns. Homicides peaked among those aged 20-24 with 7.2 homicides per 100,000, where suicides peaked among those aged 85 and older with 24.8 suicides per 100,000.
• More than half of homicides (65.3%) and more than half of suicides (60.7%) were committed using firearms.
• Suspicion of intoxication was reported in 28.6% of homicides and 18.6% of suicides.
• For homicide incidents where one or more suspects were identified, the relationship of the victim to the suspect was known (current or former spouse/boyfriend/girlfriend, family, friend or acquaintance) more frequently for female (100.0%) than male (53.3%) victims.
